Subject: MTM series or parallel

I'm going to build a pair of floor-standers for a friend who wants an MTM configuration for the system. I need to have the mid-range drivers operate at 8 ohms because he uses an OTL amp and I want to have a nice benign load. My question is if either will work in the design:

Do you prefer a 4 ohm pair in series, or a 16 ohm pair in parallel, and why?

Thanks.
