Okay so my 2pi Tower kits have been sitting in a box since February. Finally moved into our new place and getting settled in, and so anxious to start the build.

I am planning on building a 2pi as a center channel. In order to fit into my TV stand, I need to cut the height of the woofer box. Its my understanding the tweeter does not need to go into the woofer box (sealed back), so I was thinking of using the standard 2pi baffle dimensions, only with the woofer box shortened/deepened to fit my space.

Please reference attached pic, let me know what you think. I also have the baffle angled towards the seated ear position. Will this work?

Thanks!
