bookshelves or mounted to the wall. But there's no reason they can't be put on stands. They're light, so you'll have less problems with stability than larger speakers. When I have stands made, I like to have the platform (both upper and lower) be about 75% the same size as the speaker cabinet dimensions. Like say, a box that's 20" x 14", make the base 15" x 10" or so. You'll need to find a way to secure the speaker, which can be as simple as a back "lip" if the stand is angled back. I also like using rubber feet or a non-slip pad. In your case, the smaller speakers are light enough I might not worry about cradling them (i.e., with a "lip"), and instead, might just attach them with Velcro and/or rubber non-slip feet or pad.
