Hm, I'd try half of that 113k value, say standard 56k. As you said, suprisingly, there are not too much RIAA deviation with some resistor values changes (tenths of dB, or 1 dB "over" 20 Hz in your case), but those deviations are in "wide" frequency spectrum and can be heard.

Quick calculation gives $R_{out} \sim 28k$ from SRPP (must be measured or at least calculated and/or simulated), and when we use about 56k for series resistor in parallel with 1 Meg, this gives:

$R = (28+56) \times 1000 / (28+56+1000) = 77,5 k$, about right.
