As I mentioned in my previous post, for my first 4pi build I glued all joints using PL, and then screwed them together using 1 1/2" #8 brass wood screws. I guess I didn't realize the cabinet could be completely held together by PL alone. Actually, I suppose I should even ask if PL is the right glue to use. I assumed so since it is what the instructions called for with my F20 builds. (At least I didn't use sheetrock screws)

Am I going to run into issues with my 4pi, or is it supposed to have screws used? After screwing up on my first 4pi build in which I used Arauco, I was happy with the results of my second one (which is now really the first one) using the baltic birch.

I hope I don't have to start all over again. :-/
