It is the few extra inches of width that start to make the speakers look bigger. I knew what I was getting in to.

I spliced in a new piece of veneer over the worst weak spot. It appears to be a nice splice.

Assuming that I can get it sanded flush with the surrounding veneer, I can live with the other weak spots. I was able to pick up a Minwax pen that had varnish/stain in it for the other weak spots.

Those spots are mostly along the edge of the woofer. It is a little blotchy, but acceptable. When I stand back 3 feet or more, I don't cringe any more.
