I'm planning on ordering a pair of 4 Pi speaker kits and a pair of 3 Pi subwoofer kits soon. This afternoon I happened to be at Home Depot, so I grabbed some MDF. The 1/2" looked like about the right thickness, so that's what I picked up.

Now looking on the forums, it looks like 5/8" is the recommended thickness. Home Depot looked like they only had 1/2 and 3/4". Should I stick with the 1/2" I bought, swap it for 3/4", or find somewhere with the 5/8"? I might be over thinking this, but I'm ramping up my research on this new DIY tube amp and speaker setup.
