Wayne, your stands angle the speakers up towards the listener. Was this done for a reason other than aesthetics? What are you aiming for, tweeters firing at ear level? Would conventional stands work as well and how high should they be based on the listening height?

One more question if you don't mind. I live in Costa Rica and have access to all kinds of tropical solid woods (only harvested from fallen trees), in many cases for less money than cabinet grade plywood. Could I go this route and what density would be ideal?

Will be ordering the kit soon. Always a challenge getting parts here from the states without paying the ridiculously high tariffs.

Just finished a pair of Bill Fitzmaurice's Omni15 PA speakers for my band. Really looking forward to this project.

Thank you.
