Having moved to a much smaller listening room (not to mention new city), I've not been able to set up my speakers in a way that produces a distinct sound stage, and I think it has a lot to do with too much bouncing around the walls. My current room is about 12' x 14' x 8'. My back is against one wall, speakers on the long wall in front of me (7' apart, 18" from wall). Some here will know that my set up is rather 4-pi like in that I use a JBL 2226 on the bottom, similar size cabinet, etc, same kind of crossover (different attenuation) but on top I use GPA driver (299?) on an Edgar Tractrix horn (800hz, crossed about 1200). So.... I'm contemplating seeing what a more pi like setup would do by switching to the Eminence PSD2002 and H295 horn. Right now that represents a big investment due to demands of a new home so I'm hesitant and wanted to see what kind of thoughts this forum might contribute. Thanks!
