Hi Wayne, Sounds great.

The digipot and channel selections are volatile, meaning the settings are lost if processor power is removed. However, it is assumed that power to the processor chip will always be applied (so it can listen to the remote for commands). Power to the preamp circuits can be switched by the power relay, but power to the processor should always be present.

If I understand this part... it will lose the volume, balance and input selection when powered down. So a user would need to select them to have anything function. Not really a problem as most stuff seems to do this. Am I correct?
