Subject: Digital Sampling Question

Hi Everyone, I would like some information if you please. As an analog guy , digital sampling is an area that I have not yet gotten into (yet). My question regards external analog to digital interfaces. Many are USB but need not be. How can a device with 44KHZ DACs (or ADCs as the case may be) sample music or anything for that matter at say 96K or 192K. It would seem to me that one of two things would occur, either it would have to store the signal and process it off line or not be able to do it all.

Your thoughts.....
