Wayne, Thanks, interesting links, but they seem to be focused on going from digital to analog and at the moment I'm focusing on the other end - analog to digital. Where I'm hung up is with devices that convert analog signal (audio) to digital and then feed it into a PC via USB. Many devices list a frequency of 44K HZ but say they will sample at 96,192,320K etc. What precisely are they sampling? It would seem the hardware part would limit the sampling rate.
