The graph is in imperial units,  $x_{max} = 0.126\text{in} \sim 3.2\text{mm}$ .

I have played with the default tuning winisd calculates after providing box size/port dia/port length to 40Hz. This change shows 8.86mm cone excursion @ 60Hz (still way over  $x_{max}$ ).

I am going to give unibox a whirl and see what happens.
