I think I still have a lot of sanding and painting to do on the Pi speakers I have built....and I still have three subs left to build. Building the mounts sounds like a lot of work at this point (especially 12 of them).

Parts-Express.com is selling this flat TV mount for $18.08 that I thought might work well to hold up a 1pi. In order to be able to tilt the speaker down at the appropriate angle, I would need to mount it towards the bottom of the speaker. This would require installing the binding posts towards the middle or top of the enclosure. The mounting bracket is 8.5" x 4.5" and will hold up to 50lbs. Do you see any issues with using this Wayne? Would I be putting too much stress on the lower back of the speaker? I know these might all seem like dumb questions; but after all of the sweat I have put into these, I don't feel like making a dumb mistake either

Thanks again for the top notch customer service!
