Wayne, I like to know if I have to fill with fiberglass the little gap (1 1/2" +) between the port and the baffle. And another question: As the fiberglass is 3", that placed in the baffle side and over the brace, won't block partially the air flow in the port? And finally, the fiberglass place in the back baffle won't be more than 1" from front the entrance of the port, is that all right?

Thank You

Santos
