This was so easy. Why did I wait so long to get the clamps off the floor and out of the corners?

First, I needed a crosscut sled because the miter gauge that came with my cheap-ass tablesaw sucks. Second, I thought I needed a dado set for the saw. Second, Part B, w/o a dado set I'd have to make numerous passes with the standard blade to cut the kerfs.

Well, retirement's main virtue is time and it's evil counterpart vice, empty time. I had time to fill so I made the sled this A.M. and found a website that showed drilling a hole at the back of the kerf which means only 2 saw passes per. Why didn't I think of that?

Ecco! Clamps on the wall before lunch!
