Honestly, the new tweeter is real, real close to the old tweeter. They made a good copy. The measurements I get from both are so close you get as much difference moving the microphone around.

There are a couple peaks that might get up to 95dB, but average sensitivity is lower than that, between 93dB and 94dB. It's about a decibel higher between 1kHz and 5kHz than it is between 5kHz and 10kHz too. A gradual downward trend up into the top octave.

As for whether or not I'd put an old tweeter on one side and a new tweeter on the other, I think I probably wouldn't. I suppose that's kind of a perfectionist thing, 'cause they really are close. But still, they just don't cost much money so I'd probably swap 'em both.
