Hi,

I'm currently investigating building my own speakers. I've ordered a bottlehead s.e.x amp that outputs up to 2 wpc. I'm planning to use these for music only, and even then I only care what they sound like with classical music.

At the moment I'm using them in a pretty small room (Honestly I can't really see me using them in a large room anytime soon, I'm a student).

I have zero woodworking experience but I do have a neighbour who could help me. The simpler the wood working is, the better.

Which speaker would I be best off looking at? I'm presuming that either the 4pi or 7pi are the best candidates for the amp I've bought since they have the highest efficiency. Is there a reason to pick one over the other?

(I didn't mention the 8pi because that one looks to be more complicated to build than the other two, although I could be wrong)
