I am toying with an idea of smaller sealed version of 3pi for the surrounds. It is an overkill, I know, but I figured I should at least seriously consider it before going with one of the SEOS designs. And I have the wave guides already

It looks like I can reasonably expect F3 just below 80Hz in 2 cu.ft enclosure. would 16x20 baffle require any crossover changes? I will maintain the relative positioning of the drivers as you instructed.

thank you
