Wayne,

After reading several of your postings, I think I understand how flanking subs blend with the mains to alleviate modal problems in the mid-bass region. I was wondering if it's possible to also have the flanking subs help with modal problems below 80 Hz by blending (not summing) the flanking subs with the distant subs. In other words can I get the equivalent low frequency smoothing of 4 distant subs by having 2 flanking subs + 2 distant subs.

Thanks,
Darrell
