I think the angled/wedge idea would work pretty well, but I wonder how natural it would sound having the speakers up that high.

Let me offer a suggestion. Try both of these setups for a couple days, watch a few movies on each and see which you like best.

1. Put the speakers where you have shown in your photo, above the window, near the ceiling, facing downward towards the listening area.
2. Put the speakers behind the listeners on a stand, shelf or mounted to the wall. But set them only a couple feet above the listeners, each facing the ipsilateral wall such that the angle of reflection passes through the listening area.

I realize the curtains will be in the reflection path on my suggestion #2. Try it anyway, with the curtains open and closed and see what you think.
