Subject: Low Volume Speaker

All

I have my heart set on building either a pair of 3pi or 4pi speakers, but I have one major requirement.

I currently live in an apartment where excessive volume is just not allowed. I currently have a pair of Cain and Cain 'Abbys' plus their corresponding 'Baily' sub-woofer which do not reach their full potential until I hit a volume level that is a little to much for the neighbors.

I have also gone the SET route and will be driving them with a 2a3, so efficiency is also a concern.

So my question is, which pi model '3' or '4' and corresponding drivers meet my main requirement of sounding good at low volumes (I do not plan to add any sub-woofers at this time)?

Thanks
