Hello,

Recently, I built a pair of 4Pi speakers, that sound wonderful to me!

However, I read in a review (on this site) that the horns have to be damped to avoid the "plastic" treble sound. Is there a way to damp the H290C horn? I read a lot about rope caulk, but in Europe we don't use that. Would flashing tape help to damp the horn?

Or is there another way?

Thank you very much!

(Sometimes, it feels like the low frequencies of the 4pi's are a little bit too present. Especially when you hear voices in movies. I live in a little apartment, would it hurt to attenuate the bass a little bit?)
