Hi: my brother has a set of JBL 2226J and EV DH1A and he wants to use them in a 4pi size cabinet. I don't have cabinet design or crossover info. He has asked me to help. I am not a crossover savvy guy so I am asking for help. I know at least one other member here had used this combo but it was about ten years ago and he has no record of the schematic. I am wondering a few things and that is if I should include notch filters at the impedance peaks of the DH1A? Also what kind of additional bass will adding volume in half cu ft steps make? I will stat here and will also first apologize for changing a working design all I can say is that these are the drivers that he has on hand and which he wants to use. Thanks for any help and direction. Best regards DH1A
