The really high-end Meridian stuff has been this way for 10 years or so. They pass a conventional (CD/wav) signal to their speakers where the processors filter for the driver bandwidths and pass a digital signalto a DAC channel for each driver. I'm not sure if their amps are nowdigital. They used to use analog amps after the DACs. If the amps are digital, the analog conversion would be after the digital domain voltage(pulse density or pulse width?) increase. The volume control along with all kinds of timing and tone control/equaliztion are done in those processors too. Too expensive to even tempt. Skip
