Subject: Best surrounds for 4Pi Mains

I have a 2.2 setup with 4Pi mains and 3Pi subs. I'd like to add rear speakers for a 4.2 setup. If it matters any, I'll be powering the rears with a Yamaha RX-A830 "100w/ch" receiver, while my mains are powered by a Crown XLS-1500.

I'm considering the 1Pi, 2Pi, and 2Pi Towers. I can wall mount the 1Pis, but they seem rather large and the 2Pis would be even more problematic. I'm interested in the 2Pi Towers, as they seem like a great solution, but I would like to get some feedback from others on this.

Additionally, my current speakers are made of baltic birch, but I found some ply at a local lumber dealer that consists of a thin poplar core, surrounded by MDF on both sides, and finished with grade A cherry veneer on both sides. I'm considering using this to rebuild all of my cabinets, but want to know if anybody has any experience with something like this.

Thanks!
