Hey guys,

I have components from an older ThreePi kit. Delta 12LF woofers, PSD with H290 flares and Eminence Xover PCBs with Wayne's inline resistor clusters.

I've pilfered some of the parts from the Xovers over the years (a few resistors and coils).

I'd like to build these back up using Wayne's new H290C flares and new PCBs.

What do I need to know? What different parts will I need for the Xovers?

Will the Delta 12LFs still work with these?

Part of me is thinking I should sell the H290s and Deltas and get some 15"s and go for the FourPis instead. thoughts?

Cheers,
DJ
