I was thinking of building my 7 Pi with a few modifications:

- 1) using a matrix of bracing built with 1/2 sheets of Baltic birch similar to what is done in the B&W speakers for the bass box.
 - 2) Doubling up on the thickness of the bass baffle so I could recess the flange 9/16 (but not change the internal volume)
 - 3) not using the rear reflectors for the bass. Corner walls would serve this purpose and I would come up with another approach for stability.
- Any issues with these?
