Hi,

I will start to build a pair of 4pi soon,

H290c are ordered, B&C 250 will be ordered soon, pair of 2226h & new tools are at home.

I have three questions :

About the crossover,

- Can r2a, r2b, r2c, r2d be replaced by their equivalent resistances which is ... 16Ohms.
- Same for r1a, r1b, r2c, r2d, the equivalent resistance is 25ohms.

About the damping, I'm not sure to understand what R11 or R13 means, is it only about thickness ?

(We don't use this kind of references here in Belgium)

Is 4 inch thick ok ? what about 6 inch ?

Thanks And Merry Christmas.
