Wayne Is there an explanation why zero delay was flatter then most other options I tried? Any delay configuration I tried just moved the dips somewhere else in the response?

One thing I did try before I got my new amp was to change the mains distance to further away then the real distance /auto setup suggested distance,as  I think because the sub goes through eq and sub amp it's probably behind the mains in arrival time? And delaying the subs only made this gap bigger, I know this is not the idea behind multiple subs, but from memory it may have helped raise the dip slightly in the 100hz area... I need to try it again with the new amp, I just did auto setup for distance etc.
