Hi All; Eric if you are out there; Quick question; how do you feel about A DD bridge for an SE triode, 211 or the Svetlana 572. I know the dual diodes will run 900 volts on the plate, As per the tech. bulletin. Can I ask if they will go 1100 plate voltage 70ma. plate current for 12 v. output in class A?There is an example of this on the net but no schematic.Thanks J.R.
