What we really need is a good detailed technical glossary. Maybe if everyone will help to fill in the blanks so to speak, we can build a good FAQ here. It's hard to sort out all the details both technical and subjective. It would be great to have a lits of all the popular terms and topics, along with a technical description, strengths/weaknesses and most importantly a subjective description on what it sounds like, what it offers in terms of musicality.Here is a small list, and there are probably others. Please jump in an fill in the blanks because I think this could be a very useful list.SET - Single Ended Triode or Single Ended TubePP - Push PullNFB - No feedbackUL - Ultra LinearOTL - Output Transformer-LessDC - Direct CoupledTC - Transformer coupledParafeed - Parallel transformer coupledWhat does it all mean? What is the difference between pentodes and triodes in terms of sound? Aren't there other amplifier tube types too?
