Is the pi mid horn specific to (designed for) the delta 10 and the jbl 2012 only?

Could it not be used as a general purpose "full range" horn, with a full range driver mounted to it, in an attempt to improve horizontal dispersion and perhaps dynamics?

I saw a fellow on another forum, who mounted a pair of Tang Band 1772's to a medium sized looking horn, it looked about the size of the pi midhorn, although that horn was round, with a round throat of approx 4".

He seemed quite happy with them.
