Barry, that's one of the best stories I've heard. After all these years doing email, phone and forum support, this one is one of the best.

I probably should make that more clear in the instructions, just because of this possibility. There have been plenty that have asked about the paper backing, but usually they're wondering about the sheets that are attached to the panels. In that case, the paper wouldn't hurt performance as much. It just might vibrate, and it isn't necessary. But in your case - the sheets spanning the cross-section - it's much more important that the paper be removed, for exactly the reason you've described.

Good catch finding the problem. Big time sorry it persisted so long. Makes for a funny story though!
