Hey-Hey!!!,I am prepering to test a choke for DC tolerance and self resonance.For pure AC inductance, I am going to use 60cps because it is easy. A resistor in series, to determine AC current(from teh department of redundancy department). $\{V\text{-inductor}/V\text{-resistor}\}$ times $\{R/2\pi 60\}$ =inductance in Hy.An adjustable current regulator with DC voltage supply greater than V-ac peak-to-peak ought to allow me to determine its DC tolerance. Say a 40 vac signal and a 200VDC supply feeding the current regualtor. Might have heat issues with the CCS, but that's OK, I can deal with that.Any suggestions at improving this method?regards,Douglas
