Subject: Duratex, how much to cover, and ratio to thin needed

Hi, I'm getting ready to order duratex for my 4pi, and have a few questions:

My goal is to have a medium texture, and to use the dark base w/tint added at one of the local paint shops.

1) To cover a pair, should I order a quart or a gallon? I'm guessing this will depend on whether one or two coats is recommended.

2) Any recommendations as far as thinning the duratex with water? Your preferred ratio?

3) Favorite roller?

Any suggestions/advice are appreciated.
