Hi, I'm getting ready to order duratex for my 4pi, and have a few questions:

My goal is to have a medium texture, and to use the dark base w/tint added at one of the local paint shops.

- 1) To cover a pair, should I order a quart or a gallon? I'm guessing this will depend on whether one or two coats is recommended.
- 2) Any recommendations as far as thinning the duratex with water? Your preferred ratio?
- 3) Favorite roller?

Any suggestions/advice are appreciated.
