Wayne,

thanks for responding. Possibly in the future, when I build the WE 13a horns, I would be ok with 100hz upper frequency rolloff. I plan to start that project in the near future. However, my current mids play down to 250hz -3db. Out of curiosity and actual current need, what design changes would it take to bring the upper rolloff freq of 12pi to 250hz? Is it possible?

thanks,  
Herman
