Rusty wrote on Thu, 16 August 2018 09:03An interesting article on NASA's approach to minimize launch noise from destroying their new spacecraft.

<https://interestingengineering.com/nasa-sound-suppression-system-prevents-rocket-from-exploding>

This principle of converting sound energy into heat energy is simply amazing. There is always something we can learn every day. The article mentioned that the bubbles absorbed the energy. Is that the reason for the white cloud of smoke when the space shuttle lifts off?
