Hi Everyone, I'm in the building process for a class A push-pull triode amp using 6AS7s. Target is 10 watts. It might deliver as much as 14-15 though. I'm waiting on transformers right now. I hope to post the info in about 4-6 weeks. I hear from good sources that the 6AS7 is a really nice tube and makes really nice sounding amps. We shall see. This particular amp is actually a hybrid with a digital front end and remote control. It does have the option to operate directly from a line stage though.

For those of you not familiar with the tube it is a dual triode. Low (under 250) voltage, high current (about 125ma each triode) low gain (2 ugh!) and has a dissipation of 13 watts per triode octal tube. Definitely a different thing for me since most of my designs are running about 450VDC.
