Just got done comparing the "Tributary power manager" to, I believe it was called "electricstrip". What was interesting was that in order to maximize the sonic potential of each, the AC line polarity switch needed reversing when changing from one to the other. I don't know how others "conditioners" fair, but one may or may not be able to accurately compare any two "conditioners" without utilizing a polarity switch. I thought the experiment was interesting. Take care. Steve
