Hi, Not to knock anyone's mother...I doubt it. Same goes for watching too close and other similar folk tales. In the really early days of TV the tubes sometimes (in poorly designed sets) would emit more Xrays than we now allow...but with flat screen TVs this is a thing of the past. There are no XRays emitted. If darkness was a problem movie theaters would not use it. I would keep just enough light around so as to not fall on your face heading for the fridge for a cold one. :lol:
