Very good experimentation, and useful information. Thanks for the feedback.

I have almost always found that flanking subs are a first priority, and one or two distributed subs are next in priority. But sometimes the priorities switch - Rooms that have very stark deep bass modes in the 40-80Hz range might benefit more from distributed multisubs than from flanking subs. But you really need three or four subs to provide multisub smoothing anyway, so two of them might as well be flanking subs. Flanking subs always double as two of the bass sources of a three or four sub multisub arrangement.
