I've studied this for my entire adult life.

My conclusions are that:

- 1. We can measure things that we cannot hear.
- 2. Some of the things we can measure matter more than others.

So I can reach a few conclusions from this:

- 1. If I cannot measure a difference, then I certainly cannot hear a difference.
- 2. If I can measure a difference, then I may or may not be able to hear a difference.
- 3. To tell how audible a measurable difference makes, one can employ subjective blind listening tests. That will help determine what is audible, and by how much.
