Subject: 4 Pi vs Competitors

All,

I'm considering purchasing a set of 4 Pi speakers ($1,000 each) and a set of 3 Pi subs ($500 each). Without selecting additional upgrades, the cost excluding receiver/amps comes to $3,000. I live in a house with an average size living room. I use my speakers for vinyl (Project record player), movies, and music streaming (Spotify, Pandora, etc.). I know two people who have built Pi speakers (and they love their setups), but I would prefer to purchase pre-built speakers.

My question for the community: Is Pi the correct route to take? I realize that there is a lot of subjectivity in preference, and passion in building your own speakers. I am prepared to spend $3,000 - $4,000 on a great audio setup. Do you all mind weighing in on why Pi might be the right/wrong route, and other competitors to consider/disregard?

Really appreciate the help
