My impression from this fellows website is that he seems to feel that current audio is not aligned with whatever he believes he's on to. As he claims in, "The serious flaws of voltage drive:  
Quote:Today, all commercially available audio amplifier and loudspeaker equipment works on voltage drive principle without significant exceptions. This means that the amplifier acts as a voltage source and therefore exhibits low output impedance. Thus, the amplifier as though forces the voltage across the load terminals to follow the applied signal without any regard to what the current through the load will be.

So... as I'm of no judge to know what in heck he's presenting, I defer to wiser minds than mine. There's no shortage of kook's on the internet. He's selling his book only at least, which may be labeled under "fiction".
