I looked it up. They are converting radio waves into the audible part of the spectrum. There are no molecules close enough in space to transmit any sound, low, high or anything in between. I saw on a show a former astronaut explain the lack of sound in space by stating an obvious reason, the sun, there are massive explosions occurring all the time, that if there were sound transmitted through space, we'd be bombarded with intolerable noise. I have a gripe always with movies and television shows adding space noise, under the premise I guess that the public just expects noise from kinetic occurrences. The only movie I know that got it right was the classic Kubrick's, Space Odyssey.
