DIYers, have you ever noticed that it's tougher to repair and upgrade visual equipment on your own than it is audio equipment? If you want a better audio setup you can always upgrade your speakers, add a soundbar, or reposition the speakers you already own to best work with the acoustics in that room. Turntables, speakers, and radios can all be repaired at home. However, if something goes wrong with your television, you pretty much have to send it off to the manufacturer or buy another one. Why is it so much tougher to work on visual equipment at home?
