Subject: Acoustics in exposed brick and metal room

The apartment is modern and gorgeous, but the acoustics are horrendous. It's an open concept living room and kitchen with exposed brick on all sides, a concrete floor, and metal plumbing hanging from the ceiling. It used to be an industrial plant I believe. I have already added many thick rugs across the space and it hasn't helped much at all. I got the television off the wall and placed it on a cabinet instead, but things are still a mess. How can I make the acoustics better? Would removing the home theater speakers make a difference? We're renting the apartment on a short-term lease of six months, so I can't making any wild changes. I can't imagine dealing with this for the next five or so months though. The walls are thick and it's nice to not hear my neighbors at all, but everything vibrates and I have to shout in order for Alexa to hear me.
