Thanks for the detailed reply, Wayne.

As I was itching to get going, over the summer I built the Three Pi with the Delta 12LFA as a stop gap and whilst it's very nice I can't help feeling that there are further improvements to be had.

It's easy enough to find the centre again for re-routing the rebate (already had to do it once after realising the rebate was slightly too tight after I'd already removed the centre cutout) so I don't mind a larger diameter driver if it has better performance.

Thanks to Symphonimind for suggesting the Delta Pro 12A which I'm sure is an substantial improvement. I don't mind paying a bit more for the B&C if it's significantly better. If there's any way you can help in quantifying the difference in sound quality between the two to help in making a choice it would be much appreciated.
